THE CRANE CONVERTIBLE

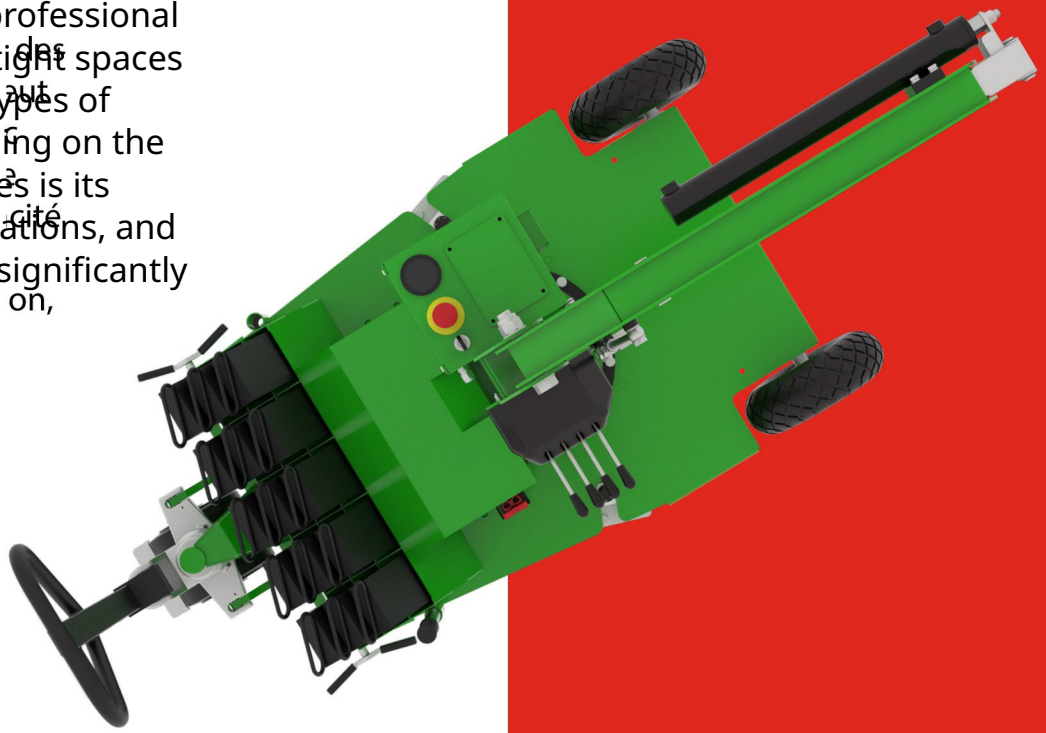

Designed to perform and adapt

MG4000

Stockman
The handling company

The MG400 is a counterweight crane with a rotating boom that adapts to an unlimited number of applications across a wide range of professional settings, ensuring incredible maneuverability— especially in tight spaces and on uneven ground. This crane can be configured with 4 types of wheels (pneumatic, solid rubber, nylon, super-elastic) depending on the ground conditions where it will be used. One of its key features is its ability to perform precise and rapid lifts, even in complex situations, and to speed up construction and installation processes, thereby significantly improving work efficiency.

Thanks to its foldable boom, removable counterweights (20 mini counterweights weighing 10 kg each), and compact size (only 780 mm wide), this crane can be transported on any utility vehicle and moved using a forklift or construction site lifting equipment.

The weight without the counterweights is only 250 kg.

The MG400 crane is often used to lift, move, and assemble materials of various sizes and weights on construction sites, such as ceramic tiles, glass panes and windows, concrete blocks, assembly equipment, and prefabricated panels. It is also used for infrastructure maintenance in residential and industrial buildings. Thanks to its adjustable leveling legs, it can also be used on uneven terrain.

KEY FEATURES

Stockman
The handling company

Some examples of materials that can be lifted in the construction industry:

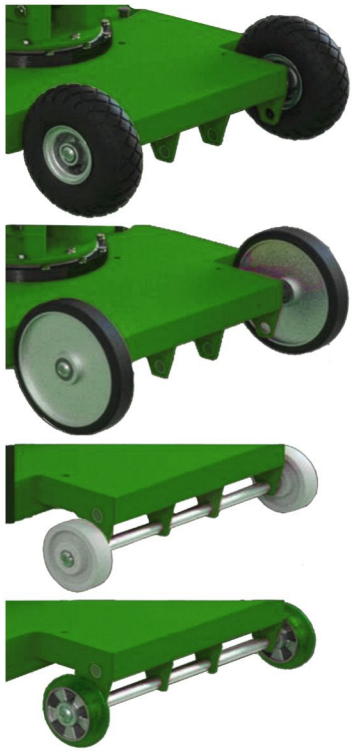

- Structural elements: columns, pillars, floors, roofs, drywall, and solar panels.
- Construction materials: bricks, bags of cement, wooden, metal, or concrete beams, flooring, doors, and windows.
- Equipment: boilers, air conditioners, generators, storage batteries.
- Work tools: construction machinery, toolboxes, compressors.

In general, the MF450 is the ideal tool for lifting and transporting all types of loads that cannot be lifted manually due to their weight and size.

Other sectors:

- Public entities that need small, easily transportable cranes for the maintenance of infrastructure (bridges, viaducts, tunnels, aqueducts), public parks, street furniture, and monuments.
- The oil and gas industries that require extremely reliable lifting equipment to withstand the harsh working conditions associated with the construction and installation of pipelines and gas stations, as well as to perform maintenance work.

4 types of wheels available and interchangeable for all types of surfaces

2 types of pumps available for raising and lowering the boom: Standard configuration: single-acting lifting pump
Optional double-acting lifting pump

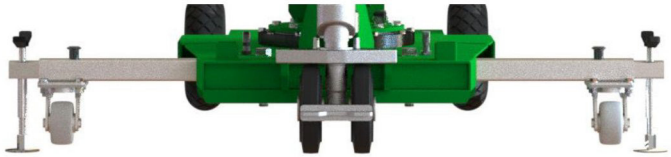

Its total height of less than 1,200 mm in the folded position allows the crane to be transported on any commercial vehicle.

Optional quick-mount leveling legs

APPLICATIONS

THE IDEAL CRANE FOR CONSTRUCTION SITES

Our cranes are used on construction sites to handle a variety of loads, such as ceramic tiles, panels, and bulk materials. Thanks to their compact design and removable counterweights, they can be transported in freight elevators. Optional leveling legs allow them to operate on uneven ground.

AN EFFECTIVE SOLUTION FOR REPAIR AND MAINTENANCE TASKS

Compact counterweight cranes are an indispensable tool for maintenance in both civil and industrial settings. Their foldable boom allows them to be transported on utility vehicles. Their tight turning radius facilitates the lifting and positioning of loads in confined spaces.

ASSEMBLY OF COMPONENTS IN THE AEROSPACE, RAILROAD, AND SHIPBUILDING INDUSTRIES

The MG400 is the most flexible tool for assembling mechanical parts, chassis, engines, and housings in industries that manufacture aircraft, trains, and ships. It can be moved through tunnels and passageways with obstacles to be positioned close to loading areas.

THE MOST EFFICIENT SOLUTION FOR INSTALLING GLASS PANELS

Cranes with counterweights and removable stabilizers offer the most flexible and safest solution for installing glass panels, window frames, heat pumps, and energy storage systems. They are the preferred choice for companies involved in the renovation and construction of civil and industrial buildings.

A SAFE LIFTING SOLUTION FOR THE MAINTENANCE OF PUBLIC INFRASTRUCTURE

Our cranes have been chosen by local and public authorities that require compact, easily transportable cranes for the maintenance of infrastructure (bridges, viaducts, tunnels, aqueducts), public parks, street furniture, and monuments.

MG400: THE UNIVERSAL AND CONVERTIBLE HANDLING CRANE

The MG400 has unlimited applications. It is a mini-crane that requires no installation and helps prevent musculoskeletal disorders. It is a durable crane with zero environmental impact. Compliant with current operator safety regulations. Reliable, versatile, and made in Italy.
